

Module 2 Lab 1: Python Warm-Up + First Push

Name: Ramisha Tasfia

This notebook works through Steps 1–6 of the Module 2 Lab 1 assignment: core Python constructs, a dictionary, and loading/inspecting `chickwts.csv` with pandas.

Step 1: Wages with f-strings

```
In [1]: name = "Ramisha Tasfia"
        hourly_wage = 32.00
        hours = 20
        weekly_pay = hourly_wage * hours
        print(f"{name} earns {weekly_pay} per week")
```

Ramisha Tasfia earns 640.0 per week

Step 2: Count the warm days

```
In [2]: temps = [61, 65, 72, 58, 70, 74, 68]
        warm_days = 0
        for t in temps:
            if t > 65:
                warm_days = warm_days + 1
        print(warm_days)
```

4

Step 3: Write a temperature converter

```
In [3]: def to_celsius(f):
        return (f - 32) * 5 / 9

        print(round(to_celsius(temps[0]), 1))
```

16.1

Step 4: A movie dictionary

```
In [4]: movie = {"title": "Inception", "year": 2010, "rating": 8.8}

        for key, value in movie.items():
            print(key, ":", value)
```

```
title : Inception
year : 2010
rating : 8.8
```

Step 5: Load and inspect chickwts.csv

```
In [5]: import pandas as pd

df = pd.read_csv("chickwts.csv")
df.head()
```

```
Out[5]:
```

	weight	feed
0	179	horsebean
1	160	horsebean
2	136	horsebean
3	227	horsebean
4	217	horsebean

```
In [6]: df.shape
```

```
Out[6]: (71, 2)
```

```
In [7]: df.describe()
```

```
Out[7]:
```

	weight
count	71.000000
mean	261.309859
std	78.073700
min	108.000000
25%	204.500000
50%	258.000000
75%	323.500000
max	423.000000

Step 6: Interpret describe()

It tells me that the average weight of chicks was approximately 261 grams, and since the middle value is 258 g, it's close to average. Also it indicates that the distribution of weights is fairly wide and somewhat non-random. The lowest weight recorded was 108 grams while the highest was 423 grams. This suggests there could be significant differences in how well the various feeds work with

regard to growth. To get a clearer picture of these differences, I would have to break down the data into each feed type rather than treating them as a whole.

Appendix: AI Use Disclosure

Tool used: Claude (Anthropic), via Claude Code / Cowork.

How it was used: Used Claude to help build the code cells for Steps 1-5, following the patterns from the lab's tutorials. I reviewed and ran every cell myself and chose my own values for Step 1. I wrote the Step 6 interpretation myself.

Key prompts:

- "Build the Module 2 Lab 1 notebook (steps 1-5) following the tutorial patterns exactly, using chickwts.csv."
